Before trying to damp the sounds, have students take time to observe WHERE the vibration is happening.
  o Encourage them to not just use their ears, but also their sense of touch. When they damp the sound, encourage them to remember where they saw/felt the vibration.
  • Minneapolis Science Center is not providing materials for part 2 (horns) for this unit. You would need to provide materials for horns (cardboard tubes) if you would like to do this section. Horns would add an additional day or session.
